

FinCoSkew

Updated: 31 Mar 2016

Use [FinCoSkew](#) to calculate the coskewness of an asset return and a benchmark return. [FinCoSkew](#) is calculated as:

$$\text{FinCoSkew} = \frac{\sum_{i=1}^n (R_{a_i} - \overline{R_a})(R_{b_i} - \overline{R_b})^2}{n}$$

Where

- Ra = asset return
- Rb = benchmark return
- $\overline{R_a}$ = average asset return
- $\overline{R_b}$ = average benchmark return
- n = number of non-NULL rows

Syntax

```
Public Shared Function FinCoSkew(  
    ByVal Ra As Double(),  
    ByVal Rb As Double(),)
```

Arguments

Ra

the asset return for a period; the percentage return in floating point format (i.e. 10% = 0.10). *Ra* is an expression that returns a **Double**, or of a type that can be implicitly converted to **Double**.

Rb

the benchmark return for a period; the percentage return in floating point format (i.e. 10% = 0.10). *Rb* is an expression that returns a **Double**, or of a type that can be implicitly converted to **Double**.

Return Type

Double

Remarks

- If *Ra* IS NULL or *Rb* IS NULL then that row is not included in the calculation.
- If n = 0 then NULL is returned.
